EDUCATION

Kennesaw State University

Expected December 2027

B.S. Computer Science · GPA 3.56 · Presidential Scholarship

TECHNICAL SKILLS

Languages: Python, JavaScript, SQL, R, Java

AI / ML: PyTorch, TensorFlow, Scikit-learn, LangChain, RAG, Hugging Face, OpenAI API, Claude API, CNNs, U-Net, transfer learning

Backend & Cloud: Flask, FastAPI, AWS, Docker, REST APIs, Git/GitHub

EXPERIENCE

Kennesaw State University — NIH-Funded Research

Sep 2025 – Present

Undergraduate Research Assistant, AI/ML Engineering · Kennesaw, GA

Built an end-to-end retinal image analysis system using Python and PyTorch across 3 clinical datasets (6,000+ images) to help detect eye diseases earlier; the pipeline is part of an ongoing NIH-funded study on automated diagnosis.

Improved fovea detection accuracy to **84.97%** — surpassing an existing published benchmark — by redesigning the model training approach and data processing strategy.

Caught and fixed a data quality issue (duplicate images leaking across train/test splits) by writing a custom audit script, preventing misleading accuracy results and keeping the research integrity intact.

PROJECTS

Green-Flight Carbon Optimizer | Python, SQL, Power BI

Jan 2026

Engineered a data pipeline in Python to ingest live flight state vectors via the OpenSky API, specifically targeting 15+ concurrent operations at Hartsfield-Jackson (ATL).

TariffCheck — AI-Powered Customs Duty Auditor

Mar 2026

Python · Flask · React · Docker · Claude API · Nexlayer | **2nd Place, Finance Track — Hacklanta 2026 at Georgia State (50+ teams)**

Automated commercial invoice review against a 10,000-page US customs database using Claude API for document parsing and classification, cutting manual audit time from hours to under 30 seconds.

Designed a multi-step classification pipeline that detects HTS tariff code errors and auto-generates official CBP legal protest documents, surfacing thousands of dollars in potential duty recovery per audit.

Led backend and deployment as the sole deployment engineer; shipped a working Flask + React + Docker application live to Nexlayer within 12 hours of the hackathon start.

U-Net Optic Disc Segmentation

Feb 2026

PyTorch · ResNet34 · Albumentations · Google Colab Pro | github.com/eymen160/unet-optic-disc-segmentation

Independently designed a ResNet34-based U-Net for medical image segmentation on the REFUGE2 eye dataset; reached **84.61% segmentation accuracy** on a clean, leakage-free test set after discovering and removing contaminated training data.

LEADERSHIP & RECOGNITION

Vice President, Global Development and Networking Club — KSU

2025 – Present

Organized Youth Convention 2025 with speakers from Meta, Avanade, and Emory University; directed panels, a networking fair, and technical workshops for 60+ students.
