

EYMEN FARUK KEYVAN

678-670-4474 · eymenfaruk479@gmail.com · Atlanta, GA · Open to relocation anywhere in the US
eymenkeyvan.com · linkedin.com/in/eymenkeyvan · github.com/eymen160

Computer science student who ships to production: a live Laravel/MySQL order platform, two Next.js apps, and PyTorch pipelines for an NIH-funded clinical study. Twice caught data bugs that passing tests and clean-looking metrics had missed. Seeking a Summer 2027 software engineering or machine learning internship anywhere in the US.

EDUCATION

Kennesaw State University

Expected December 2027

B.S. Computer Science · GPA 3.56 · Presidential Scholarship

Relevant Coursework: Algorithm Analysis, Data Structures, Operating Systems, Artificial Intelligence, Big Data Analytics (Spark/Hadoop), Object-Oriented Programming

TECHNICAL SKILLS

Languages: Java, Python, JavaScript/TypeScript, SQL, PHP

AI / ML: PyTorch, TensorFlow, Scikit-learn, CNNs, Transfer Learning, LLM APIs (Claude, OpenAI) with tool calling and structured outputs, RAG, Evals/Benchmarking

Web & Backend: React, Next.js, Tailwind CSS, Node.js, Laravel, Flask, FastAPI, REST APIs, webhooks, queued jobs

Data & Cloud: MySQL, PostgreSQL, AWS, Cloudflare (R2, D1), Docker, Linux, CI/CD (GitHub Actions, Railway, Vercel), Git, Agile/Scrum

Agentic Dev Tooling: Claude Code, Codex CLI, Hermes Agent, MCP servers; built a three-agent workflow with separated roles where git hooks block any agent from reaching production without human review and passing regression tests

EXPERIENCE

FOMA — Custom-Print E-Commerce

Apr 2026 – Sep 2026

AI Automation Intern (Part-time) · Remote

- Shipped features to the live order-management platform (Laravel 12, Filament, MySQL) that processes 12,000+ orders a month.
- Built the company's two Next.js apps: fomaprint.com, the public storefront (Tailwind CSS, Cloudinary, 800+ products), and FomaHub, an internal portal used by 50+ store operators (Prisma, PostgreSQL).
- Self-hosted the storefront on a Linux server (Docker, Caddy, Cloudflare R2/D1) behind a GitHub Actions pipeline that builds over SSH, health-checks each release, and rolls back automatically on failure.
- Wrote the ShipStation integration that syncs orders automatically (REST APIs, queued jobs, webhooks) and validated it against real order traffic instead of fixtures.
- Built the SKU-mapping engine for marketplace orders; testing it on real orders exposed a null-variant case in 78% of order lines that seeded test data never produced, which had been mis-mapping shipments.

Kennesaw State University — NIH-Funded Research

Sep 2025 – Present

Undergraduate Research Assistant, AI/ML Engineering · Kennesaw, GA

- Built a retinal image analysis pipeline in Python and PyTorch across 3 clinical datasets (6,000+ images) for an ongoing NIH-funded study on automated eye-disease diagnosis.
- Raised fovea segmentation to an **84.97%** Dice score, beating a published benchmark, by reworking training and data preprocessing.
- Wrote an audit script catching train/test leakage from duplicate images; removing them lowered scores but kept results honest.

PROJECTS

Hey Buddy — Real-Time Phone Interpreter

Sep 2026

1st Place, ElevenLabs Track — HackGT 13 (850 participants, 57 teams) | React · Twilio · ElevenLabs · Grok · hey-buddy.tech

- Built with a two-person team in 36 hours: a live interpreter that joins real phone calls over Twilio Media Streams and translates between English and 5 languages (ElevenLabs speech-to-text and text-to-speech, Grok translation) at a 0.9 s median per turn.
- Flags scam cues (payment, identity, remote access) mid-call with Grok and alerts a trusted contact over WhatsApp; Meta Muse Spark writes a post-call summary.
- Built the React web app in 6 UI languages, including right-to-left Arabic: a family portal with call recordings and summaries, plus a CRM dashboard for businesses; Node.js/Socket.IO backend on Railway with 250+ automated tests.

TariffCheck — AI-Powered Customs Duty Auditor

Mar 2026

2nd Place, Finance Track — Hacklanta 2026 (50+ teams) | Python · Flask · React · Docker · Claude API · tariffcheck-zeta.vercel.app

- Audits commercial invoices against a 10,000-page US tariff corpus using Claude, flags HTS classification errors, and drafts CBP protest documents, cutting hours of manual review to under 30 seconds.
- Led backend and deployment; the Flask + React + Docker app was **live 12 hours into the hackathon**.

LEADERSHIP

Vice President, Global Development and Networking Club — KSU

2025 – Present

- Organized Youth Convention 2025 for 60+ students, with speakers from Meta, Avanade, and Emory.
